Freud’s psychological work began with the study of the neuroses and developed into a unique – psychoanalytic – perspective on these mysterious disorders. This psychoanalytic perspective, in turn, changed the very way we think of and define neurosis and, in addition, showed how it can be treated through psychoanalysis. What Freud discovered is that neurotic symptoms and behavior had a meaning – were a complex mixture that at one and the same time both expressed and defended against unacceptable impulses, thoughts, and wishes, which, most importantly, were largely unconscious, typically involved sexuality and aggression and originated in childhood. In this course we will examine the various neuroses and the distinct mechanisms that they each employ. We will read about hysteria and obsessional neurosis, and explore what they reveal about psychic functioning. Finally, we will examine the relationship between neurosis and character.

SESSION 1 (Nov 20): Introduction to Hysteria.

Learning objective: to gain an understanding of early psychoanalytic thoughts about the concept of hysteria and the discovery of the “talking cure.”

SESSION 2 (Dec 4): Hysteria and its Etiology. Introduction to the psychoanalytic concept of neurosis and its place in the landscape of psychopathology.

Supplemental Reading:

Learning objective: To gain a further understanding of the psychoanalytic view of hysteria and its treatment - the nature of conversion and the specific psychical mechanisms at play in hysteria. To examine the concept of neurosis including symptom formation, unconscious conflict and defense and their role in psychopathology.

SESSION 3 (Dec 11): Hysteria (continued)

Supplemental Readings:

Learning objective: To understand the relationship of psychosexual development, sexuality and bodily functions to symptom formation and the theory of the neuroses.

SESSION 4 (Dec 18): Hysteria and Dissociation

Learning objective: To examine the role of trauma in hysteria and to explore the relationship between hysteria and dissociation. To understand the difference between the repression model with the dissociation model.

SESSION 5 (Jan 22): Obsessional Neurosis

1. Freud, S. (1909), Notes upon a case of obsessional neurosis, S.E. 10, 153-249. PEP Web Link

2. Fisch, Marcia (1999 unpublished), Rat Man: The case. [Available in the Library]

Learning objective: To gain an understanding of the psychoanalytic view of obsessional neurosis and its treatment – the nature of obsessions, compulsions, isolation of affect and the specific psychical mechanisms at play in obsessional neurosis. To gain an understanding of the relationship between obsessional neurosis and the Oedipus conflict.

SESSION 6 (Jan 29): The Rat Man Reconsidered: Revisions of Freudian Theory and contemporary issues.

Learning objective: To gain an understanding of contemporary psychoanalytic views of obsessional neurosis and its treatment—a re-evaluation of what was therapeutic in the Rat Man case (Osman) and the role of developmental trauma in the formation of obsessional symptoms (Brandchaft). Bechdel provides a contemporary, and creative, example of the development of OCD symptoms and their transformation.

SESSION 7 (Feb 5): Neurosis and Character

Supplemental Readings:

Learning objective: To gain an understanding of the psychoanalytic view of character and psychological structure and its relationship to the neuroses. We will explore the concept of neurotic character and its various types including in everyday life.

SESSION 8 (Feb 12): Neurosis and Character Continued

Learning Objective: To further interrogate the concept of character and its relationship to neurosis.

The seminar is relevant for clinicians in that it provides an introduction to the psychoanalytic understanding and treatment of the neuroses (hysterical and obsessional) and other neurotic level disorders. Candidates will learn about symptom formation and the basic mechanisms of action of these disorders and how these inform treatment. The seminar will cover both theory and clinical practice and the discussion will be closely tied to clinical observations. Candidates will be encouraged to relate the theories to their clinical practice.
