Transference, Counter-Transference and their Relationship to Therapeutic Action in Psychoanalysis

ATP II, Spring 2016

Instructors: Julia Matthews and Lilia Feinberg

“Without ... transference – of the intensity of the unconscious, of the infantile ways of experiencing life that have no language and little organization, but the indestructability and power of the origins of life – to the preconscious and to the present day life and contemporary objects – without such transference, or to the extent to which transference miscarries, human life becomes sterile and an empty shell.

... There is neither such a thing as reality nor a real relationship without transference. Any "real relationship" involves transfer of unconscious images to present day objects. In fact, present day objects are objects, and thus real, in the full sense of the work only to the extent to which this transference ... is realized.”

Hans Loewald (1960)

Transference is a central concept in psychoanalytic psychotherapy. In this course, we will examine the concept of transference from its historical beginnings to its present elaborations. We will explore the usefulness of working with transference for understanding the past and helping to create therapeutic change in the present. We will look at different kinds of transferences and different ways of working with transference. We will also consider the relationship between transference and countertransference, touching on related concepts of projective identification, role responsiveness, enactment, the therapist’s use of reverie, and the question of therapist self disclosure.

Throughout this course we will draw on clinical examples, from the literature and from our own work, to enrich and enliven our understanding. As fundamental psychoanalytic concepts, transference and countertransference are closely tied to the question of what constitutes therapeutic action, that is, how do we best achieve needed improvements in our patients? The class is encouraged to bring in brief vignettes with this question in mind: how do I recognize the presence of transference and its nature?
Syllabus

Week 1 - March 24 - Freud’s discovery of Transference
Freud, S. (1905) Fragment of an Analysis of a Case of Hysteria. S. E., 7: 112-122, Postscript. PEP Web Link

Main topic for discussion: The first two of these readings are Freud’s earliest concise descriptions of the phenomenon of transference and the third elaborates his observations. Together they describe how Freud made the leap from transference as an impediment to teaching the patient about their neurosis to recognizing that the transference provides a lived repetition of the original conflict that created the patient’s disturbance and an essential aspect for understanding and transforming neurotic symptoms.

Learning objective for this session: The participants will be able to describe the nature of transference, the origin of transference in early life, and the double aspect of transference as resistance to change and a means to change, all as these were conceptualized by Freud.

Week 2 - March 31 - further development of Freud’s ideas about transference
Freud, S. (1915) Observations on Transference Love. S. E., 12: 159-171. PEP Web Link

Main topic for discussion: These two readings bring a full description of the transference as reflecting a “new edition” in the present of the original neurosis, providing the means to resolve forgotten trauma and repressed conflicts. The therapist must largely allow the transference the freedom to emerge unchallenged, in its fullness of affect, to be gradually understood/interpreted with the patient.

Learning objective for this session: The participants will be able to provide a detailed description of Freud’s understanding of the transference as a repetition within the treatment that can and must be used therapeutically toward resolution of unconscious conflicts.

Week 3 - April 7 - The central role of transference in ego psychology

Main topic for discussion: These papers offer a deepened understanding of the mental capacity to form transferences and specifically the transference neurosis, the required deep involvement of the analyst/therapist in the emergence of the transference neurosis, and thus
the centrality of the countertransference. Bird further considers the tendency to focus on libidinal aspects of the transference at the expense of aggressive aspects that often appear in the form of seemingly intractable resistances. Both Loewald and Bird also introduces a distinction between the transference neurosis, ‘ordinary’ and automatic transference reactions, and reactions based in ‘reality’ – a distinction that continues to haunt and confuse.

Learning objective for this session: The participants will be able to define ‘transference neurosis’ and describe how it is conceptualized as distinct from transference reactions characteristic of all human relationships (including also the therapy relationship).

**Week 4 – April 14 - The transference use of the analyst**

Main topic for discussion: The central themes of this weeks relatively brief readings are 1) the unavoidable involvement of the therapist’s psyche (including his/her own transferences) and the impact on the patient; and 2) how the patient experiences and uses the therapist developmentally (in contrast to predominantly as an interpreter) to achieve greater self differentiation, relying on the therapist’s capacity to respond at the developmental and emotional level required by the patient.

Learning objective for this session: The participants will be able to discuss the forms transferences take when working with patients who are functioning (whether consistently or transiently) at pre-oedipal levels.

**Week 5 – April 21 - (Lilia) Countertransference**

OR

Main topic for discussion: Our readings move away from viewing countertransference as “analyst's blind spot,” and something to eradicate, to viewing countertransference as transference in the analyst. This perspective also brings attention to the “real” analyst as a source of patient’s phantasies and associations.

Learning objective for this session: Participants will be able to describe a difference between old views on countertransference as a hindrance to psychoanalytic discourse and modern
views - transference in the analyst – which, together with the patient’s transference, creates a combined dynamic unconscious.

**Week 6 – April 28 (Lilia) - Self psychological views of transference**

**Main topic for discussion:** Self-object transference is concerned with the patient’s moment-to-moment self-experience. Self-object transference is established in response to deficits and developmental arrests rather than intrapsychic conflicts.

**Learning objective for this session:** Participants will be able to describe self-object transferences in analytic and other relationships as well as different ways of working with these transferences and the related defenses.

**Week 7 – May 5 - (Lilia) - Klein, neo-Kleinians and Bion**

**Main topic for discussion:** Transference as a total situation is an actualized living experience of the patient in analysis. Analyst and patient co-create a narrative based on a notion of a shared unconscious phantasy.

**Learning objective for this session:** Participants will be able to describe a meaning of a transference as a total situation and differentiate object relational approach to transference from an ego-psychological one.

**Week 8 – May 12 - Transference and countertransference as shared enactment**

**Main topic for discussion:** Analytic enactments are viewed as events occurring within the psychoanalytic dyad that both parties experience as being the consequence of behavior in the other.
Learning objective for this session: Participants will be able to describe an evolving transformation of the concept of enactment from viewing it as “misbehavior” on the patient’s or analyst’s part to viewing it as inevitable co-creation of the analytic dyad.

Week 9 – May 19 - Mutual involvement in therapeutic process (moving to intersubjectivity)

Main topic for discussion: Analytic material emerges from interplay between the minds of patient and analyst. Analysts have different reactions to being their patients’ transference objects. The analyst’s relationship (transference) to analytic theory may play a significant role in that reaction. Self-analysis and working through in the analyst plays an important role in the therapeutic action of analytic treatment.

Learning objective for this session: Participants will be able to describe how analysts deal with being THE object of patient’s transference, and the role self-analysis and working through in the analyst plays in modern psychoanalytic treatment.

Week 10 – May 26 - Intersubjective perspectives on Erotic Transference/Countertransference

Main topic for discussion: These articles provide a fascinating dialogue about sources of and handling of powerful countertransferences, particularly erotic feelings, and whether self-disclosure is useful.

Learning objective for this session: Participants will be able to discuss the origin of erotic countertransference within the therapy dyad and will be able to think critically about the function of self-disclosure.
