## **Self Psychology**

**Instructors: Richard Gomberg and Rafael Ornstein**

As a post-Freudian psychoanalytic theory, self-psychology is continually undergoing changes and transformations. These changes have two major sources:

The first is related to the fact that the theory as it was originally articulated by Heinz Kohut over a period of less than two decades, contained ideas the meanings of which could only become clear with time and increasing clinical experience. The best example of this is the self-object concept: originally a purely intrapsychic concept, the concept now includes intersubjective and relational perspectives.

The second major source of changes is related to the fact that there is a continuous, imperceptible influence that all psychoanalytic theories exert on each other. While each theory attempts to preserve its “purity,” discussions of clinical material reveal that analysts’ private theories (Sandler) have multiple theoretical sources.

-----

This course of eight, one and a half hour sessions can only be an overview in which we will focus on the most essential features of self-psychology. We will aim for a systematic presentation recognizing that all psychoanalytic theories have to meet the criteria of inner consistency: all clinical theories are based on clinical observations (transferences) which have to be supported by a theory of development and a theory of psychopathology.

CME Objective:

Self-psychology is a clinically focused theory that bridges theory of development, psychopathology therapeutic process and curative action. By demonstrating knowledge of the precepts of this theory participants will be more skilled in treating a wide range of patients with a sophisticated psychoanalytic approach.
